Details

Hygiene is of the utmost importance in the food industry. At entrances to a production area in many slaughterhouses and dairies for example, a walk through hygiene station is a requirement.

This hygiene station is an integrated, “all in one” station which allows the all important hygiene measures to take place simultaneously: contactless hand cleaning and sole disinfection. The SMP 8500 series is used to monitor the entering and leaving of the station, offering a reliable control that the required measures are being followed.

The first SMP 8500 mounted at the entrance side of the handrail on the left detects the person stepping on to the station, and opens the turnstile at the other end. The soap and water are vaporised for a thorough hand cleaning without touching the dispenser. At the same time, a cleaning solution and water are brought by separate pipes and mixed on the brushes located along the floor of the hygiene station so that the soles of the shoes are also disinfected.

The second SMP mounted on the right hand side, detects the person stepping off of the hygiene station, stopping engines and pumps, and therefore the flow of cleaning materials. The turnstile is closed.

There are many variations of hygiene stations available.
